

DYADEMA™, A TECHNOLOGICAL GEM

Brembo presents a brand-new product at IAA: Dyadema™, the exclusive new brake caliper for the highest-performance supercars

Dyadema™ is the most advanced caliper that Brembo has ever put into production for road cars: an innovation that has all the technical features and design of a product destined to outperform the rest, bringing a range of unique advantages to the next generation of supercars.

Dyadema™ is a monobloc 6-piston aluminium caliper with innovative air cooling technology, incorporated during the casting process. The caliper integrates a pioneering cooling duct that increases the airflow around the brake pads. Thanks to this forced ventilation, the caliper operates at lower temperatures and therefore delivers better, more consistent performance.

The increase in airflow reduces the brake fluid temperature up to 15% compared with a standard caliper, allowing the system to maintain maximum braking efficiency.

Dyadema™ offers the best cooling capacity of any brake caliper ever produced by Brembo, delivering a consequent increase in performance and a reduction in braking distance.

The product's unique airflow feature is a natural outcome of Brembo's research for maximum performance; and is an outstanding example of cooperation between supplier and car manufacturer to obtain an innovative product that is integrated into the vehicle's design.

In developing the new **Dyadema™** caliper, Brembo has underlined its DNA as an experimenter and researcher of braking solutions that continue to raise the already high standards of the company's products.

The caliper is a combination of innovation and performance, fun and technology, with design details that echo the high performance caliper styling for which Brembo is already renowned.
